Fundamentals of Fourier Transform Infrared Spectroscopy ... Fourier-transform infrared spectroscopy (FTIR) is a technique used to obtain an infrared spectrum of absorption or emission of a solid, liquid or gas. An FTIR spectrometer simultaneously collects high-resolution spectral data over a wide spectral range. This confers a significant advantage over a dispersive spectrometer, which measures intensity over a narrow range of wavelengths at a time. Fourier-transform infrared spectroscopy - Wikipedia FTIR stands for Fourier transform infrared, the preferred method of infrared spectroscopy. When IR radiation is passed through a sample, some radiation is absorbed by the sample and some passes through (is transmitted). The resulting signal at the detector is a spectrum representing a molecular 'fingerprint' of the sample. FTIR Spectroscopy Basics | Thermo Fisher Scientific - US Fourier Transform Infrared Spectroscopy (short FT-IR) is one of the techniques that are used today for measuring the intensity of infrared radiation as a function of frequency or wavelength.
