 This book presents a comprehensive description of the configuration of devices and network for the S7-400 components inside the engineering framework TIA Portal. You learn how to formulate and test a control program with the programming languages LAD, FBD, STL, and SCL. The book is rounded off by configuring the distributed I/O with PROFIBUS DP and PROFINET IO using SIMATIC S7-400 and data exchange via Industrial Ethernet. SIMATIC is the globally established automation system for implementing industrial controllers for machines, production plants and processes. SIMATIC S7-400 is the most powerful automation

system within SIMATIC. This process controller is ideal for data-intensive tasks that are especially typical for the process industry. With superb communication capability and integrated interfaces it is optimized for larger tasks such as the coordination of entire systems. Open-loop and closed-loop control tasks are formulated with the STEP 7 Professional V11 engineering software in the field-proven programming languages Ladder Diagram (LAD), Function Block Diagram (FBD), Statement List (STL), and Structured Control Language (SCL). The TIA Portal user interface is tuned to intuitive operation and encompasses all the requirements of automation within its range of functions: from configuring the controller, through programming in the different languages, all the way to the program test. Users of STEP 7 Professional

V12 will easily get along with the descriptions based on the V11. With start of V12, the screens of the technology functions might differ slightly from the V11.

The Internet is often called a superhighway, but it may be more analogous to a city: an immense tangle of streets, highways, and interchanges, lined with homes and businesses, playgrounds and theatres. We may not physically live in this city, but most of us spend a lot of time there, and even pay rents and fees to hold property in it. But the Internet is not a city of the 21st century. Jeffrey Hunker, an internationally known expert in cybersecurity and counter-terrorism policy, argues that the Internet of today is, in many ways, equivalent to the burgeoning cities of the early Industrial Revolution: teeming with energy but also with new and previously unimagined dangers, and lacking the technical and political infrastructures to deal with these problems. In a world where change of our own making has led to unexpected consequences, why have we failed, at our own peril, to address these consequences? Drawing on his experience as a top expert

in information security, Hunker sets out to answer this critical question in *Creeping Failure*. Hunker takes a close look at the "creeping failures" that have kept us in a state of cyber insecurity: how and why they happened, and most crucially, how they can be fixed. And he arrives at some stunning conclusions about the dramatic measures that we will need to accomplish this. This groundbreaking book is an essential first step toward understanding the World Wide Web in a larger context as we try to build a safer Internet "city." But it also raises issues that are relevant far outside the online realm: for example, how can we work together to create not just new policy, but new kinds of policy? *Creeping Failure* calls for nothing less than a basic rethinking of the Internet — and of how we solve problems together.
